The product, which is Page Mode Flash memory, is a low power, high density, low cost, nonvolatile read/write storage solution for a wide range of applications. The product can operate at V_{CC} =2.7V-3.6V. Its low voltage operation capability greatly extends battery life for portable applications.

The product provides high performance asynchronous page mode. It allows code execution directly from Flash, thus eliminating time consuming wait states.

The memory array block architecture utilizes Enhanced Data Protection features, and provides separate Parameter and Main Blocks that provide maximum flexibility for safe nonvolatile code and data storage.

Fast program capability is provided through the use of high speed Page Buffer Program.

Special OTP (One Time Program) block provides an area to store permanent code such as a unique number.

Table 1. Pin Descriptions

Symbol	Type	Name and Function
A ₀ -A ₂₁	INPUT	ADDRESS INPUTS: Inputs for addresses. 64M: A ₀ -A ₂₁
DQ ₀ -DQ ₁₅	INPUT/ OUTPUT	DATA INPUTS/OUTPUTS: Inputs data and commands during CUI (Command User Interface) write cycles, outputs data during memory array, status register, query code and identifier code reads. Data pins float to high-impedance (High Z) when the chip or outputs are deselected. Data is internally latched during an erase or program cycle.
CE#	INPUT	CHIP ENABLE: Activates the device's control logic, input buffers, decoders and sense amplifiers. CE#-high (V_{IH}) deselects the device and reduces power consumption to standby levels.
RST#	INPUT	RESET: When low (V_{IL}) , RST# resets internal automation and inhibits write operations which provides data protection. RST#-high (V_{IH}) enables normal operation. After power-up or reset mode, the device is automatically set to read array mode. RST# must be low during power-up/down.
OE#	INPUT	OUTPUT ENABLE: Gates the device's outputs during a read cycle.
WE#	INPUT	WRITE ENABLE: Controls writes to the CUI and array blocks. Addresses and data are latched on the rising edge of CE# or WE# (whichever goes high first).
V _{CC}	SUPPLY	DEVICE POWER SUPPLY (2.7V-3.6V): With $V_{CC} \le V_{LKO}$, all write attempts to the flash memory are inhibited. Device operations at invalid V_{CC} voltage (see DC Characteristics) produce spurious results and should not be attempted.
GND	SUPPLY	GROUND: Do not float any ground pins.

- NOTES:
 See DC Characteristics for V_{IL} or V_{IH} voltages.
 X can be V_{IL} or V_{IH} for control pins and addresses.
 RST# at GND±0.2V ensures the lowest power consumption.
 Command writes involving block erase, full chip erase, (page buffer) program or OTP program are reliably executed when V_{CC}=2.7V-3.6V.
 Refer to Table 4 for valid D_{IN} during a write operation.
 Never hold OE# low and WE# low at the same timing.
 Refer to Appendix of LH28F640BF series for more information about query code.

- 1. Bus operations are defined in Table 3.
- 2. The address which is written at the first bus cycle should be the same as the address which is written at the second bus cycle.
 - X=Any valid address within the device.
 - IA=Identifier codes address (See Table 2).
 - QA=Query codes address. Refer to Appendix of LH28F640BF series for details.
 - BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.
 - WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.
 - OA=Address of OTP block to be read or programmed (See Figure 3).
- 3. ID=Data read from identifier codes. (See Table 2).
 - QD=Data read from query database. Refer to Appendix of LH28F640BF series for details.
 - SRD=Data read from status register. See Table 7 and Table 8 for a description of the status register bits.
 - WD=Data to be programmed at location WA. Data is latched on the rising edge of WE# or CE# (whichever goes high first).
 - OD=Data to be programmed at location OA. Data is latched on the rising edge of WE# or CE# (whichever goes high first).
 - N-1=N is the number of the words to be loaded into a page buffer.
- 4. Following the Read Identifier Codes/OTP command, read operations access manufacturer code, device code, block lock configuration code, and the data within OTP block (See Table 2).
 - The Read Query command is available for reading CFI (Common Flash Interface) information.
- 5. Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when RST# is V_{IH} .
- 6. Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.
- 7. Following the third bus cycle, inputs the program sequential address and write data of "N" times. Finally, input the any valid address within the target block to be programmed and the confirm command (D0H). Refer to Appendix of LH28F640BF series for details.
- 8. Full chip erase and OTP program operations can not be suspended. The OTP Program command can not be accepted

while the block erase operation is being suspended. 9. Following the Clear Block Lock Bit command, the selected block is unlocked regardless of lock-down configuration. 10. Commands other than those shown above are reserved by SHARP for future device implementations and should not be used. 11. When the status register data is read, input the address to which the erase or program operation is executed.
used. 11. When the status register data is read, input the address to which the erase or program operation is executed.

Table 5. Functions of Block Lock⁽⁴⁾ and Block Lock-Down

		(2)		
State	$DQ_1^{(1)}$	$DQ_0^{(1)}$	State Name	Erase/Program Allowed (2)
[00]	0	0	Unlocked	Yes
$[01]^{(3)}$	0	1	Locked	No
[10]	1	0	Unlocked	Yes
[11]	1	1	Locked	No

NOTES:

- 1. DQ_0 =1: a block is locked; DQ_0 =0: a block is unlocked. DQ_1 =1: a block is locked-down; DQ_1 =0: a block is not locked-down.
- 2. Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
- 3. At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [01] regardless of the states before power-off or reset operation.
- 4. OTP (One Time Program) block has the lock function which is different from those described above.

Table 6. Block Locking State Transitions upon Command Write

Current State Result after Lock Command Written (Next St					n (Next State)

[10]	1	0	[11]	No Change	[11] ⁽²⁾
[11]	1	1	No Change	[10]	No Change

- 1. "Set Lock" means Set Block Lock Bit command, "Clear Lock" means Clear Block Lock Bit command and "Set Lock-down" means Set Block Lock-Down Bit command.
- 2. When the Set Block Lock-Down Bit command is written to the unlocked block ($DQ_0=0$), the corresponding block is locked-down and automatically locked at the same time.
- 3. "No Change" means that the state remains unchanged after the command written.

NOTES:

Check SR.7 to determine block erase, full chip erase, (page buffer) program or OTP program completion. SR.6 - SR.1 are invalid while SR.7="0".

If both SR.5 and SR.4 are "1"s after a block erase, full chip erase, page buffer program, set/clear block lock bit, set block lock-down bit, attempt, an improper command sequence was entered.

SR.1 does not provide a continuous indication of block lock bit. The WSM interrogates the block lock bit only after Block Erase, Full Chip Erase, (Page Buffer) Program or OTP Program command sequences. It informs the system, depending on the attempted operation, if the block lock bit is set. Reading the block lock configuration codes after writing the Read Identifier Codes/OTP command indicates block lock bit status.

SR.15 - SR.8, SR.3 and SR.0 are reserved for future use and SR.3 = RESERVED FOR FUTURE ENHANCEMENTS (R) should be masked out when polling the status register.

After issue a Page Buffer Program command (E8H), XSR.7="1" indicates that the entered command is accepted. If XSR.7 is "0", the command is not accepted and a next Page Buffer Program command (E8H) should be issued again to check if page buffer is available or not.

XSR.15-8 and XSR.6-0 are reserved for future use and should be masked out when polling the extended status register.

NOTES:

1. All currents are in RMS unless otherwise noted. Typical values are the reference values at V_{CC} =3.0V and T_A =+25°C unless V_{CC} is specified.

5. Sampled, not 100% tested.

I_{CCWS} and I_{CCES} are specified with the device de-selected. If read or (page buffer) program while in block erase suspend mode, the device's current draw is the sum of I_{CCWS} or I_{CCES} and I_{CCR} or I_{CCW}, respectively.
 Block erase, full chip erase, (page buffer) program and OTP program are inhibited when V_{CC}≤V_{LKO}, and not guaranteed

outside the specified voltage.

^{4.} The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t_{AVQV}) provide new data when addresses are changed.

t _{WHR0} (t _{EHR0})	WE# (CE#) High to SR.7 Going "0"	3, 6		t _{AVQV} + 50	ns

- 1. The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program and OTP program operations are the same as during read-only operations. Refer to AC Characteristics for read-only operations.
- 2. A write operation can be initiated and terminated with either CE# or WE#.
- 3. Sampled, not 100% tested.
- 4. Write pulse width (t_{WP}) is defined from the falling edge of CE# or WE# (whichever goes low last) to the rising edge of CE# or WE# (whichever goes high first). Hence, t_{WP}=t_{WLWH}=t_{ELEH}=t_{WLEH}=t_{ELWH}.

 5. Write pulse width high (t_{WPH}) is defined from the rising edge of CE# or WE# (whichever goes high first) to the falling
- edge of CE# or WE# (whichever goes low last). Hence, twpH=twHwL=teHeL=twHeL=teHwL.

 6. twHR0 (teHR0) after the Read Query or Read Identifier Codes/OTP command=taVQV+100ns.
- 7. Refer to Table 4 for valid address and data for block erase, full chip erase, (page buffer) program, OTP program or lock bit configuration.

- 1. V_{CC} power-up and standby.
- 2. Write each first cycle command.
- 3. Write each second cycle command or valid address and data.
- 4. Automated erase or program delay.
- 5. Read status register data.
- 6. For read operation, OE# and CE# must be driven active, and WE# de-asserted.

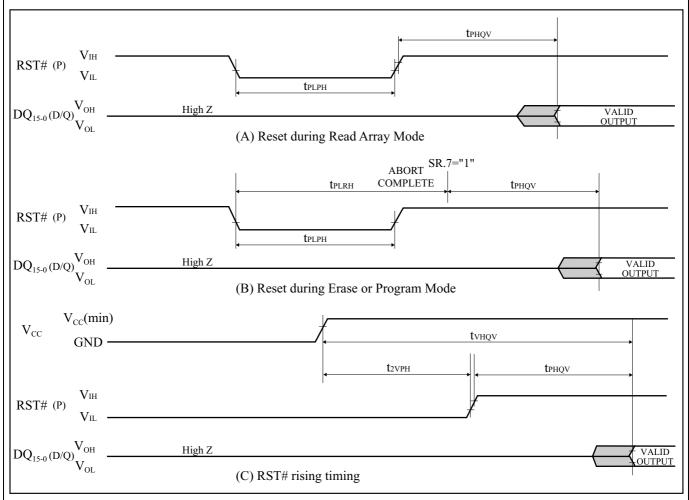

Figure 9. AC Waveform for Reset Operations

Reset AC Specifications (V_{CC} =2.7V-3.6V, T_A =0°C to +70°C)

Symbol	Parameter		Min.	Max.	Unit
$t_{\rm PLPH}$	RST# Low to Reset during Read (RST# should be low during power-up.)	1, 2, 3	100		ns

t _{2VPH}	V _{CC} 2.7V to RST# High	1, 3, 5	100		ns
t_{VHQV}	V _{CC} 2.7V to Output Delay	3		1	ms

- 1. A reset time, t_{PHQV}, is required from the later of SR.7 going "1" or RST# going high until outputs are valid. Refer to AC Characteristics Read-Only Operations for t_{PHQV}.
- 2. t_{PLPH} is <100ns the device may still reset but this is not guaranteed.
- 3. Sampled, not 100% tested.
- 4. If RST# asserted while a block erase, full chip erase, (page buffer) program or OTP program operation is not executing, the reset will complete within 100ns.
- 5. When the device power-up, holding RST# low minimum 100ns is required after V_{CC} has been in predefined range and also has been in stable there.

$t_{ m ERES}$	Latency Time from Block Erase Resume Command to Block Erase Suspend Command	5	-	500			μs

^{1.} Typical values measured at V_{CC} =3.0V and T_A =+25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.

^{2.} Excludes external system-level overhead.

^{3.} Sampled, but not 100% tested.

^{4.} A latency time is required from writing suspend command (WE# or CE# going high) until SR.7 going "1".

^{5.} If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t_{ERES} and its sequence is repeated, the block erase operation may not be finished.

A-1 RECOMMENDED OPERATING CONDITIONS

A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

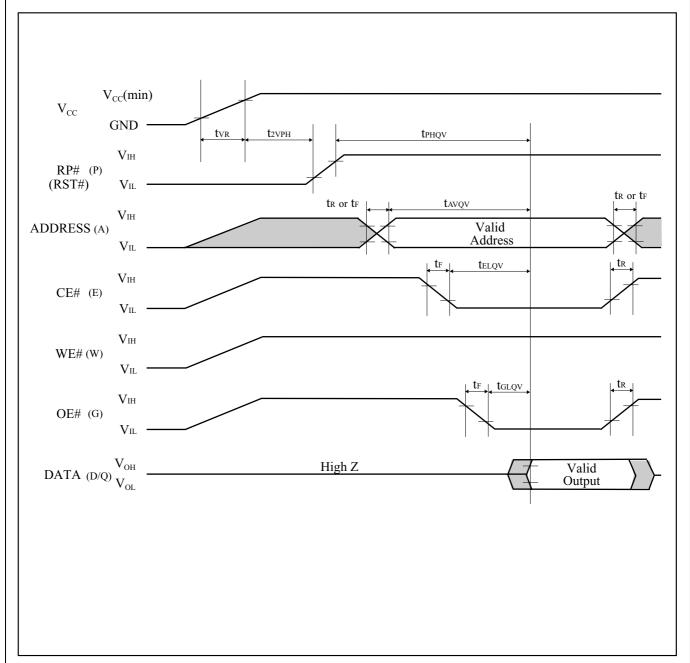

Figure A-1. AC Timing at Device Power-Up

For the AC specifications t_{VR} , t_R , t_F in the figure, refer to the next page. See the "ELECTRICAL SPECIFICATIONS" described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

A-1.1.1 Rise and Fall Time

t _R	Input Signal Rise Time	1, 2		1	μs/V
t _F	Input Signal Fall Time	1, 2		1	μs/V
